1. Introduction

Thank you for choosing the Nimbus SaaS Landing Page Template. Nimbus is a clean, modern, fully responsive landing page built for software-as-a-service products, startups, and digital agencies. It is built using only HTML5, CSS3, and vanilla JavaScript — no frameworks, no build tools, and no dependencies to install.

This documentation will walk you through the file structure, the technologies used, how to install and preview the template, and step-by-step instructions for customizing colors, fonts, content, images, and the contact form.

2. File Structure Overview

The template is organized into the following folders and files:

Path	Description
index.html	Main landing page containing all sections (Hero, Features, About, Services, Pricing, Testimonials, Contact, Footer).
css/style.css	Single stylesheet containing all design styles, color variables, and responsive media queries.
js/script.js	Handles mobile navigation toggle, smooth scrolling, scroll animations, back-to-top button, and form interactions.
images/	Folder containing all image assets used across the page (hero image, avatars, logos, etc.).
documentation.pdf	This file - full setup and customization guide.
readme.txt	Quick-start instructions in plain text format.

3. Technologies Used

- HTML5 — Semantic markup (header, nav, section, footer, form, etc.) for accessibility and SEO.
- CSS3 — Custom styling with CSS variables (custom properties), Flexbox, and CSS Grid for layout.
- Vanilla JavaScript (ES6) — No external libraries or frameworks. Handles navigation, smooth scroll, and animations.
- Google Fonts — 'Poppins' for headings and 'Inter' for body text, loaded via CDN link.

Note: This template does NOT use Bootstrap or any CSS framework. All layout and components are written from scratch in `css/style.css`, which keeps the codebase lightweight and easy to customize.

4. Installation & Getting Started

Since this is a static HTML template, no installation or build process is required.

Step 1: Extract the `saas-template.zip` file to a folder on your computer.

Step 2: Open the `'saas-template'` folder.

Step 3: Double-click `'index.html'` to open it in your web browser.

Step 4: To edit, open the project folder in a code editor such as Visual Studio Code.

Optional (recommended for development): Use a local server such as the VS Code `'Live Server'` extension so that changes auto-refresh in the browser:

1. Install the `'Live Server'` extension in VS Code.
2. Right-click `index.html` and select `'Open with Live Server'`.

5. Section-by-Section Guide

Section	HTML id / class	Purpose
Header / Navigation	<code>#header</code> , <code>.site-header</code>	Sticky top navigation with logo, menu links, and CTA buttons.
Hero	<code>#home</code> , <code>.hero</code>	Main banner with headline <code>'Build Your SaaS Faster'</code> , subtext, CTA buttons, and dashboard image.
Logos	<code>.logos</code>	Row of trusted brand/client logos.
Features	<code>#features</code>	Grid of 6 feature cards highlighting product benefits.
About	<code>#about</code>	Company story, image, and key statistics.
Services	<code>#services</code>	Grid of 4 service cards describing what you offer.
Pricing	<code>#pricing</code>	3-column pricing table (Starter, Professional, Enterprise).
Testimonials	<code>#testimonials</code>	Customer review cards with ratings and avatars.
CTA	<code>.cta</code>	Full-width call-to-action banner before the contact section.
Contact	<code>#contact</code>	Contact information and a working front-end contact form.
Footer	<code>.site-footer</code>	Site links, social icons, and newsletter signup.

6. Customization Instructions

6.1 Changing Colors & Theme

All colors are controlled using CSS custom properties (variables) defined at the top of `css/style.css` inside the `:root` selector. Update these values to re-theme the entire site instantly:

```
:root {
  --color-primary: #5b5bf6;
  --color-secondary: #8b5cf6;
  --color-accent: #06b6d4;
  --color-bg: #ffffff;
  --color-bg-alt: #f7f7fd;
  --color-text: #1f2230;
}
```

6.2 Changing Fonts

Fonts are loaded from Google Fonts in the `<head>` of `index.html` (Poppins for headings, Inter for body text). To change fonts:

1. Replace the Google Fonts `<link>` tags in `index.html` with your preferred font.

2. Update the font variables in `css/style.css`:
`--font-heading: 'Poppins', sans-serif;`
`--font-body: 'Inter', sans-serif;`

6.3 Editing Text Content

All text content lives directly inside `index.html`. Each section is wrapped in an HTML comment for easy navigation, for example:

```
<!-- ===== HERO ===== -->
```

Simply locate the section you want to edit, then change the text inside the HTML tags. For example, to change the hero headline, edit the text inside the `<h1 class="hero-title">` tag.

6.4 Replacing Images

All images are referenced from the `'images/'` folder using relative paths (e.g. `images/hero.png`). To replace an image:

1. Add your new image file into the `'images'` folder.
2. Either rename it to match the existing filename, or update the `'src'` attribute in `index.html`.

Recommended image sizes:

File	Recommended Size	Used In
------	------------------	---------

hero.png	1000 x 760 px	Hero section dashboard preview
about.png	900 x 760 px	About section
dashboard.png	1200 x 800 px	Optional / extra preview
avatar1.png - avatar4.png	120 x 120 px (square)	Hero avatars & testimonials
logo-brand1.png - logo-brand5.png	160 x 50 px	Trusted-by logo strip
logo.svg	34 x 34 px (vector)	Header & footer brand logo

6.5 Editing the Navigation Menu

The navigation menu is located inside the `<nav class="nav">` element in `index.html`. Each menu item is a list item containing a link with an href pointing to a section id (e.g. `#pricing`). To add a new menu item, copy an existing `<li><a>...</a></li>` block and update the href and label. Make sure the target section also has a matching id attribute.

6.6 Customizing the Pricing Table

The pricing section (`#pricing`) contains three `.pricing-card` elements. The middle card has an additional class `.pricing-featured` which applies the highlighted gradient style and the 'Most Popular' tag. To change prices, plan names, or features, edit the text inside each card. To add or remove a feature, add or remove an `<li>` item inside the `.pricing-features` list.

6.7 Connecting the Contact Form

The contact form (`#contactForm`) and newsletter form in the footer are front-end demos only — they show a success message but do not send real emails. To make them functional, choose one of the following options:

- Use a form backend service such as Formspree, Getform, or Basin — set the form's 'action' attribute to the service URL.
- Use EmailJS to send emails directly from JavaScript without a backend server.
- Build a custom backend endpoint (Node.js, PHP, etc.) and update `js/script.js` to send a `fetch()` POST request with the form data.

7. Responsive Design Notes

The layout uses CSS Grid and Flexbox with three main breakpoints defined in `css/style.css`:

- 1024px and below — grids reduce from 3-4 columns to 2 columns; section spacing is reduced.

- 860px and below — the navigation collapses into a mobile menu (hamburger icon); hero, about, and contact sections stack vertically.
- 640px and below — all grids collapse to a single column; floating hero cards are hidden for a cleaner mobile view.

8. Browser Support

This template has been built using modern, widely-supported CSS and JavaScript features (CSS Grid, Flexbox, CSS Variables, IntersectionObserver). It works in all current versions of:

- Google Chrome
- Mozilla Firefox
- Microsoft Edge
- Safari (macOS & iOS)

9. Credits & Support

Fonts: 'Poppins' and 'Inter' provided by Google Fonts (open source, free for commercial use).

Images: All images included in the 'images' folder are placeholders. Please replace them with your own licensed images, screenshots, or photography before publishing your site.

If you have questions about this template, please refer to the [readme.txt](#) file for a quick-start guide, or contact the author through your marketplace purchase page for support.

Thank you for using Nimbus!
